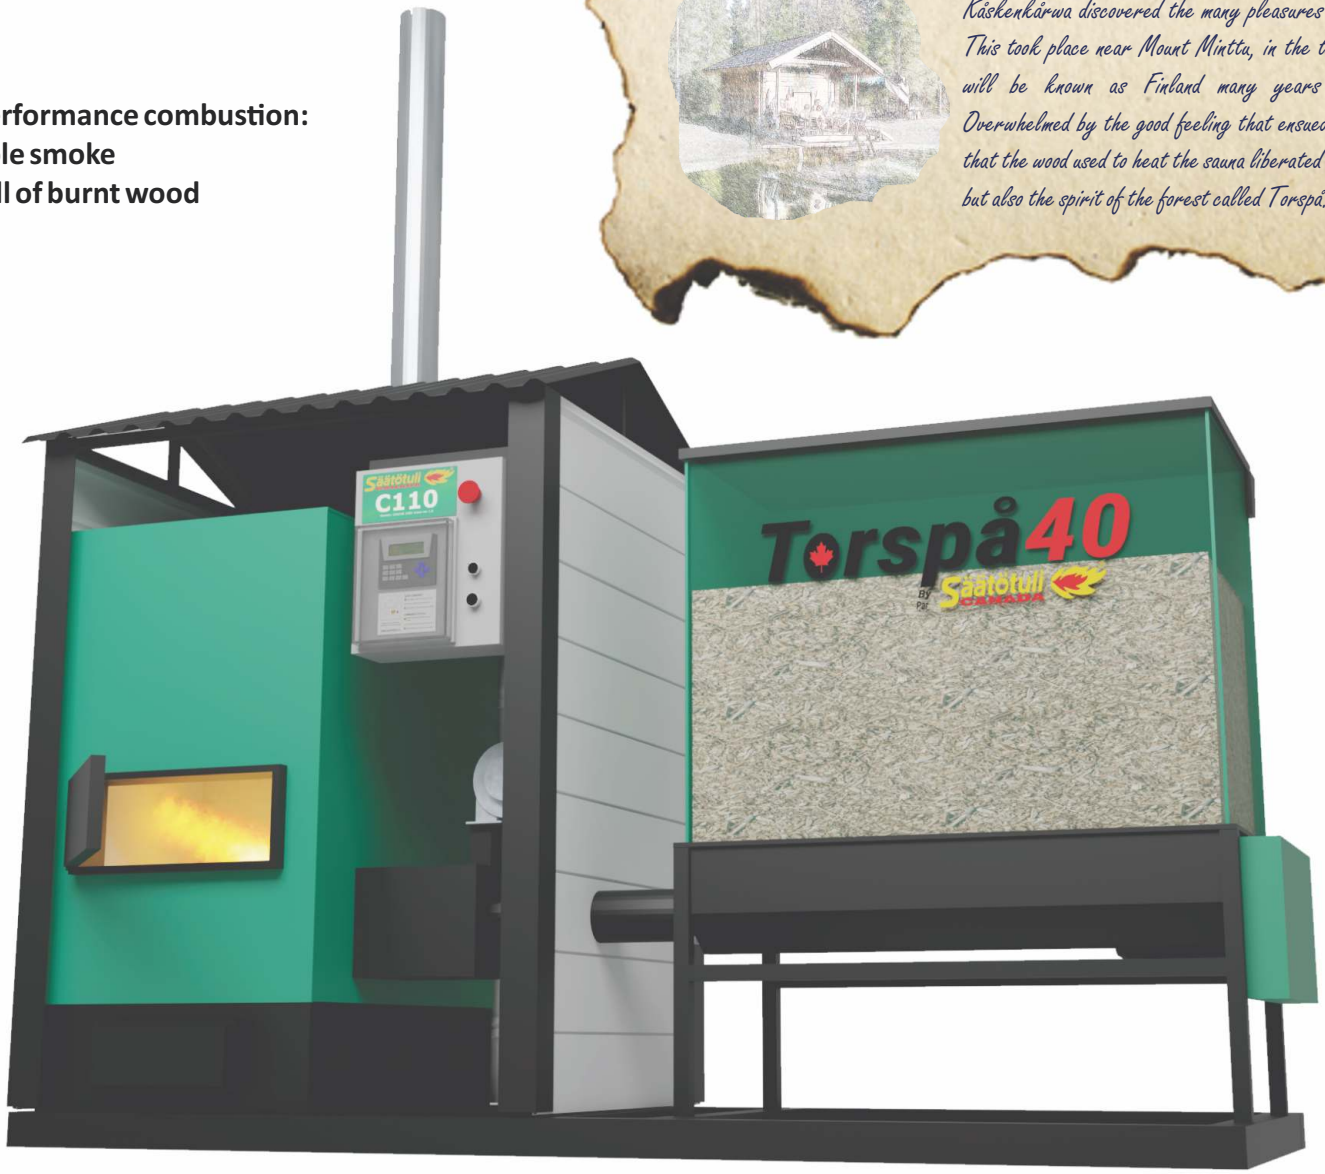
Torspå40

The next generation outdoor wood furnace

EN Sept 2021

Legend has it that in 1038, the venerable Viking explorer Kåskenkårwa discovered the many pleasures of the sauna. This took place near Mount Mintta, in the territory that will be known as Finland many years afterwards. Overwhelmed by the good feeling that ensued, he deducted that the wood used to heat the sauna liberated not only heat, but also the spirit of the forest called Torspå.

High-performance combustion:
No visible smoke
No smell of burnt wood



No more putting cordwood in your furnace twice a day !

Torspå40 uses woodchips or pellets as fuel. Its 920-liter fuel silo can be easily filled with a loader.

Torspå40 was designed to take the place of an existing outdoor furnace. It is equipped with a hot-water boiler that connects to an unpressurised hydronic heat-network. It can easily replace a furnace that has arrived at the end of its lifecycle.

Torspå40 can output continuously 136,485 BTU/hr (40kW). The C110 control automation adjusts the fuel amount depending on the heat demand. When the boiler arrives at the limit of the thermostat, the burner will simply enter idle-mode and simply keep a small quantity of embers live to remain hot.

Torspå40 connects to a 240V/60Hz washing-machine type socket.
